

Note: The instantaneous velocity, peak location, AUC, and half-width graphs were made using data from the velocity frame range (because this frame range tracks when there is a protein zone around the wound, which are the only frames we care about for making these measurements). The intensity graph was made using data from all frames (because we want to see how intensity changes throughout the whole movie). Normalization #2 was used for the AUC and intensity graphs. Normalization #1 or 2 can be used for the other graphs.
